Résumé logique	8

Environnement :

- Srv-btsdns01 → 51.255.202.249
- Srv-btsdns02 → 51.255.196.208
- Srv-btsrsync → 51.255.200.17

Objectif :

- Sauvegarde automatique Unbound depuis DNS01/DNS02 vers VPS RSYNC
- Restauration contrôlée depuis VPS RSYNC vers DNS01/DNS02
- SSH sans mot de passe (clé dédiée)
- Compatibilité UFW + fail2ban

ARCHITECTURE LOGIQUE

PRÉREQUIS COMMUNS (TOUS VPS)

Installer rsync + ssh

Sur les 3 serveurs :

```
sudo apt update  
sudo apt install -y rsync openssh-client openssh-server
```

Vérifier SSH actif

```
sudo systemctl status ssh
```

UFW (minimum recommandé)

DNS01 / DNS02

```
sudo ufw allow 22/tcp  
sudo ufw enable
```

VPS RSYNC

```
sudo ufw allow 22/tcp  
sudo ufw allow from 51.255.202.249 to any port 22  
sudo ufw allow from 51.255.196.208 to any port 22  
sudo ufw enable
```

CLÉS SSH (SANS MOT DE PASSE)

Principe

- clé backup : DNS → RSYNC
- clé restore : RSYNC → DNS

CLÉ BACKUP (DNS → RSYNC)

Sur DNS01

```
ssh-keygen -t ed25519 -f ~/.ssh/dns01-backup  
ssh-copy-id -i ~/.ssh/dns01-backup.pub backup@51.255.200.17
```

Sur DNS02

```
ssh-keygen -t ed25519 -f ~/.ssh/dns02-backup  
ssh-copy-id -i ~/.ssh/dns02-backup.pub backup@51.255.200.17
```

Sur VPS RSYNC

Créer user backup :

```
sudo adduser backup
```

CLÉ RESTORE (RSYNC → DNS)

Sur VPS RSYNC

```
sudo ssh-keygen -t ed25519 -f /root/.ssh/restore-dns
```

Déployer vers DNS01

```
sudo ssh-copy-id -i /root/.ssh/restore-dns.pub secadmin@51.255.202.249
```

Déployer vers DNS02

```
sudo ssh-copy-id -i /root/.ssh/restore-dns.pub secadmin@51.255.196.208
```

Test

```
sudo ssh -i /root/.ssh/restore-dns secadmin@51.255.202.249
```

VPS RSYNC – STRUCTURE BACKUP

Créer arborescence :

```
sudo mkdir -p /backup/dns01/current  
sudo mkdir -p /backup/dns02/current  
sudo chown -R backup:backup /backup
```

SCRIPTS BACKUP (DNS01 / DNS02)

DNS01 – backup

```
sudo nano /root/backup_unbound.sh
```

Script :

```
#!/bin/bash
```

```
BACKUP_DATE=$(date +%F)
```

```
rsync -az --delete \
```

```
-e "ssh -i /home/secadmin/.ssh/dns01-backup" \  
/etc/unbound/unbound.conf.d/ \  
backup@51.255.200.17:/backup/dns01/current/
```

Explication

- BACKUP_DATE : date (option future extension)
- rsync : synchronisation
- -a : conserve permissions
- -z : compression
- --delete : miroir exact
- ssh -i : clé SSH dédiée DNS01
- source : config Unbound
- destination : VPS central

rendre exécutable

```
sudo chmod +x /root/backup_unbound.sh
```

test

```
sudo /root/backup_unbound.sh
```

DNS02 – backup

```
#!/bin/bash
```

```
rsync -az --delete \  
-e "ssh -i /home/secadmin/.ssh/dns02-backup" \  
/etc/unbound/unbound.conf.d/ \  
backup@51.255.200.17:/backup/dns02/current/
```

AUTOMATISATION (CRON)

Sur DNS01 et DNS02 :

```
sudo crontab -e
```

Ajout :

```
0 21 * * * /root/backup_unbound.sh
```

backup automatique à 21h

VPS RSYNC – SCRIPTS RESTAURATION

RESTORE DNS01

```
sudo nano /backup/restore_dns01.sh
```

```
#!/bin/bash
```

```
rsync -rvz --delete \  
--exclude="*.bak" \  
-e "ssh -i /root/.ssh/restore-dns" \  
/backup/dns01/current/ \  
secaadmin@51.255.202.249:/etc/unbound/unbound.conf.d/
```

RESTORE DNS02

```
#!/bin/bash
```

```
rsync -rvz --delete \  
--exclude="*.bak" \  
-e "ssh -i /root/.ssh/restore-dns" \  
/backup/dns02/current/ \  
secaadmin@51.255.196.208:/etc/unbound/unbound.conf.d/
```

rendre exécutable

```
sudo chmod +x /backup/restore_dns01.sh
```

```
sudo chmod +x /backup/restore_dns02.sh
```

EXPLICATION RESTORE

- `--delete` → miroir exact
- `--exclude *.bak` → ignore fichiers de backup locaux
- `ssh -i restore-dns` → clé sans mot de passe
- destination → dossier Unbound actif

MÉTHODOLOGIE DE TEST (IMPORTANT AUDIT)

TEST 1 – SSH sans mot de passe

```
sudo ssh -i /root/.ssh/restore-dns secadmin@51.255.202.249
```

Doit se connecter directement.

TEST 2 – backup manuel

Sur DNS01 :

```
sudo /root/backup_unbound.sh
```

Vérifier sur RSYNC :

```
ls -l /backup/dns01/current/
```

TEST 3 – restore manuel

Sur RSYNC :

```
sudo /backup/restore_dns01.sh
```

TEST 4 – vérification DNS01

```
ls -l /etc/unbound/unbound.conf.d/
```

TEST 5 – cron

`sudo grep CRON /var/log/syslog`

Résumé logique

- Séparation backup / restore
- Clé SSH dédiée par flux
- Pas de root SSH distant
- Cron côté source uniquement
- Rsync centralisé
- Exclusion .bak
- Logs possibles extension
